#### Geomorphology & landscape:

Cliffs, Coastal, Crags/ledges, Intertidal rock, Island, Shingle bar

### 4.2 Quality and importance

#### ARTICLE 4.2 QUALIFICATION (79/409/EEC)

#### During the breeding season the area regularly supports:

*Phalacrocorax carbo*  
(North-western Europe)

1.35% of the breeding population  
5 year mean for 1996 - 2000

### 4.3 Vulnerability

The site is protected from most disturbance by its isolation and the policy of the landowner. However, brown rats may have impinged on the breeding bird population. Eradication in 1998 appears to have been successful but requires monitoring and mink are now a significant threat. Growth of scrub and brambles may restrict nesting sites and calls for the reintroduction of grazing animals.
